Behind the Smile
Dr. Seto Wing Chun, Adrian

Course content:
Everyone deserves a dazzling smile. A charming smile can often determine how well a person can function in a society or among the peer group. Of course, the importance given to a beautiful smile is not new. One would smile with full of confident when the teeth behind the lips are attractive. But, what if not?

Modern technologies and materials in restorative dentistry provide the clinicians a rescue tool to salvage. However, able to make ceramic crowns or veneers does not necessarily mean that the restorative outcome is aesthetic. Anterior restoration is always a challenge to most clinicians. When the prostheses to be delivered fail to match what has been promised by the operator and the patient assumption, the discrepancy of such expectation wears down the trust to the clinician.

What do the clinicians need to know in restoring the anterior teeth before asking their patients to smile in front of their peers? In this seminar, the component of building up a smile will be shared. This concept aims to assist the clinician to improve aesthetic planning, raising the acceptance of treatment procedure via anticipation of the outcome. As a result, a happy smiling patient!

Editor’s choice: Clinical performance of titanium zirconium implants with a hydrophilic surface in patients with controlled type 2 diabetes mellitus: 2-year results from a prospective case-control clinical study (Cabrera-Domínguez JJ et al., 2019).

The study analyzed the 2-year clinical performance of single-unit titanium-zirconium (TiZr) alloy narrow-diameter (3.3 mm) dental implants with a hydrophilic surface (Straumann® Roxolid®, SLActive®) in patients with controlled type 2 diabetes mellitus. Two years after implant placement and prosthetic restoration, no implant failures were reported in either group, resulting in 100% survival and success rates in both groups. This study established that reduced diameter TiZr alloy implants with a hydrophilic surface represent a safe and predictable treatment option for patients with well-controlled type 2 diabetes mellitus.

Two years after implant placement and prosthetic restoration, no implant failures were reported in either group, resulting in 100% survival and success rates in both groups. This study established that reduced diameter TiZr alloy implants with a hydrophilic surface represent a safe and predictable treatment option for patients with well-controlled type 2 diabetes mellitus.
